In overall the blast design app will provide a reliable approach to blast design by reducing the need to do manual calculations and limiting human error. As a result, this application has a potential in improving blasting efficiency, operational safety and contribute to a more productive and cost-effective mining operations.
\section{Conclusion}
The BlastSmart application provides a practical and efficient solution for performing blast design calculations. By automating calculations and reducing manual work, it accuracy, saves time and support better blast planning.
\section{Recommendations}It is recommended that the BlastSmart application be further developed to incorporate additional modules, specifically Underground Blast Design, Prediction Calculators, and Rapid Calculators, in order to deliver a more comprehensive solution for blasting engineers. Subsequent iterations of the application should implement input validation mechanisms to mitigate erroneous data entry and enhance the precision of computational outputs. Furthermore, the application should undergo evaluation by mining professionals within operational environments to assess its performance, reliability, and usability. Lastly, to ensure sustained accuracy, user-friendliness, and compatibility with evolving technological advancements in the mining sector, regular updates and systematic maintenance are advised.
